

Frutastatic

PARTHENOCARPY MAKES IT EASY

The first range of parthenocarpic squashes

Parthenocarpy is a biological trait that appears naturally in squashes. This attribute allows fruit to form when there is no pollination of female flowers.

Frutastic makes your harvests more reliable

Guaranteed yield in all circumstances

- Without pollinators
- In difficult growing conditions
- Without male flowers in the crop

Optimum fruiting without setting activator

Adapted to the requirements of organic production

Gautier Semences R&D serving pro

We have observed that parthenocarpy provides real solutions to facilitate squash production, which is why we have focused our research efforts on breeding highly parthenocarpic varieties. Frutastic® varieties are very easy to produce, have outstanding agronomic qualities and generate a very low amount of waste material. They meet production requirements in all respects. Try them now!

Lucile RETAILLEAU, Squash Breeder

Fruit quality without compromise

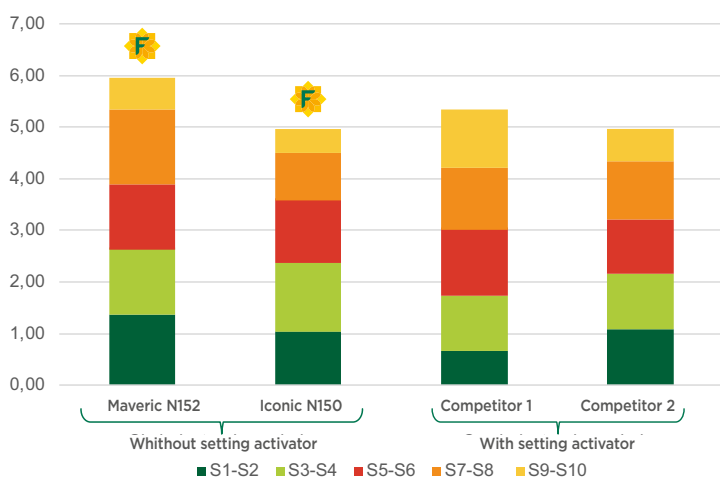

- Uniform production throughout the cycle
- Fruit calibre 14-21 cm, the market standard
- Regular cylindrical shape
- Small pistillate scar
- Attractive dark green colour
- Low wastage rate

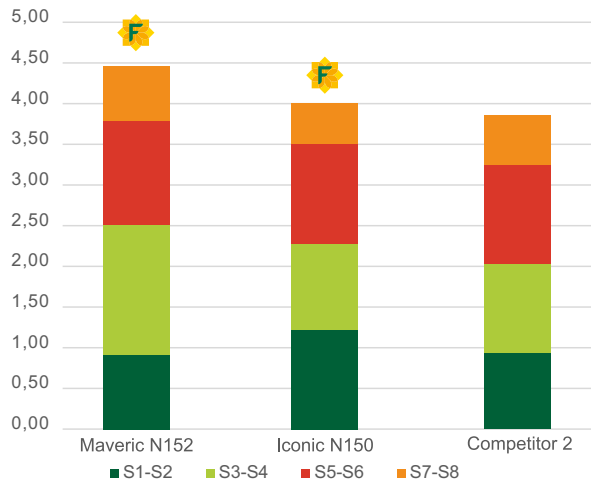

Extensive, early and continuous commercial yield throughout the cycle

Cumulative commercial yield (kg/plant)

In production conditions with setting activator

In production conditions without setting activator

Separate tests conducted between September and November 2022, Almeria zone. Average yield per plant calculation every two weeks (S).

lucers

The parthenocarpy of Frutastic® varieties is particularly interesting when the conditions for natural pollination are difficult: in indoor production or in environments with extreme climatic variations. Frutastic® offers a more reliable solution to the squashes industry by ensuring stable production, resilient to climatic conditions and with a constant and high yield, thus contributing to a more efficient and sustainable crop management.
